

CPE-592 Assignment 1

LSB and MSB Steganography are a complete opposite in appearances and encoding. We can visually differentiate the original image and encoded image in MSB steganography since it encodes the most significant bits of the pixels, changing those bits can change the intensity of the picture majorly like grayscale in my example. Whereas in LSB, encoding of least significant bits cannot be caught by a human eye, hence making it least significant bits as the name itself.
